Below are three possible topics for your short paper. The papers are to be double-spaced, 3 to 5 pages, no longer (longer papers will be rejected!). They are due by the time of class on November 20 and are to be submitted as attachments on emails sent to papers@mechanism.ucsd.edu. Each of these topics can be addressed in light of the materials we are reading for this course. In each case I am asking you to focus on material from our more theoretical discussions (November 6, 13, and 18) but to draw connections to our discussions of cognitive psychology and cognitive science (October 28 and 30). You may bring in additional material that you are familiar with, but your paper needs to reflect the readings assigned for the course. They are not to be research papers, but attempts by you to synthesize and evaluate central ideas in the material we are covering.

Regardless of the topic you choose, it will be critical that you focus your discussion. Do not try to be inclusive; rather, be highly selective and explain the material you do cover a clearly and precisely as possible. Take as your reader for the paper an intelligent fellow student who does not know the material we have read or covered in this course. Accordingly, you will have to explain the key ideas and arguments. Do so in your own words. Only quote material when the exact words in the quotation are important—for example, you are going to criticize what is said.

1. Explain (one version of) one of the three main accounts of the relation of mind to body (identity theory, functionalism, eliminative materialism), show through an example how it would apply to a specific psychological phenomenon, and defend it as the best account of the relation of mind to brain. Consider one major objection to the account and answer that objection (you won’t have the space to develop more than one in sufficient detail, so pick carefully).

2. Explain the multiple realizability argument against the reduction of psychology to neuroscience, showing how it would apply to one psychological phenomenon. Make the argument seem as compelling as possible. Describe what you take to be the most compelling objection that has been advanced to the multiple realizability argument. Evaluate whether the objection is successful or whether the claim of the multiple realizability of psychological phenomena remains a compelling argument against reduction.

3. Explain and evaluate the language of thought hypothesis. Explain what is meant by a language of thought by showing how it might be invoked in explaining one psychological phenomenon. What are the most compelling arguments for and against there being a language of thought? Restrict yourself to one argument for and one against, and develop those two arguments thoroughly and evaluate which is stronger.
